

DigitalFusion™ Platform

DigitalBridge's patent-pending DigitalFusion™ platform is a revolutionary technology platform designed to make complex manual ecosystems digital. Our Digital Packet Technology™ solutions deliver all kinds of information in context, preserving integrity, maintaining security, and protecting privacy. We support industry-accepted data standards for the various markets we serve (including Schools Interoperability Framework Association, National Information Exchange Model, Health Level 7). Dependable security protocols provide for maximum system interoperability within and among interdependent agencies in the education, healthcare, finance, and criminal justice markets. Our DigitalFusion™ platform does not require rip and replace of existing legacy systems. Any authorized user in your ecosystem can access and process information 24/7/365 over a web portal customized to their workflows.

DigitalSAMSTM Solution

DigitalBridge's innovative DigitalSAMSTM (Student Achievement Management System) solution is a student-centered achievement and management system that closes the gaps from the state and district levels to the teacher in the classroom and the parent at home. Decision makers at every level are now able to formulate knowledgeable academic plans by manipulating, comparing, and correlating individual student information, regardless of the software and platform used to store the source data. The true power of the solution is that it provides teachers and administrators easy desktop access through an Internet browser to comprehensive, dynamic, longitudinal student achievement reports, while maintaining complete control over security, privacy and access.

Digital Warrants™ Solution

DigitalBridge's efficient Digital Warrants™ solution is a web-based system for the processing of warrants. Individual case information passes through the justice ecosystem of all necessary officials digitally through DigitalFusion™ platform engine, including: the County Prosecutor, Pre-Sentencing, Court, Sheriff, Probation, and others in a secure process, saving time, money and lives.

DigitalBridge is helping the fifth largest criminal court system in the world process an annualized workflow of 70,000 warrants.

In the world of health care, many stakeholders have legitimate reasons for access to patient histories. Physicians need patient records from hospitals, radiology centers, laboratories, pharmacies and more to be interactively accessible. Admission, discharge, and transfer processes struggle under multiple systems, using disparate data sources. Insurers must track a patient's activity across multiple providers, facilities, and procedures, to accurately reimburse and report on various treatment regimens. And finally, patients need real time access to their medical records wherever and whenever it's appropriate.

Digital Packet Technology™

DigitalBridge takes your current ecosystem, the same tasks now done manually and/or across disparate information or diagnostic systems, at the cost of significant time and money, and does them more efficiently using our Digital Packet Technology™ solution.

The Packet is an XML-based document, containing aggregated current and historical content that can include disparate HIS data, images and video, dictation, scripts, and other pertinent information. Using the sophisticated governance features embedded in the Packet, patients can be authorized to control their data, and define who sees what and when.
